PROJECT OBJECTIVE

Challenge

The speed of delivery of service that Government organisations are expected to achieve for their clients has increased dramatically in recent years. The expectation is that interaction between the Government and the citizen has become more efficient and delays in decision-making should be minimised.

This expectation has led Government based organisations to investigate ways of ensuring that interaction with clients are quickly logged and handled. This is especially pertinent when the client interaction takes place in the field.

How do organisations for example surface critical centralised systems to the mobile worker, easily and securely?

Solution

BE Systems using RIM technology have assisted countless organisations to make corporate systems available through their Blackberry, reusing existing infrastructures and investment. The solution can be used to achieve simple read only systems that allow the browsing of corporate data only to a full two-way interactive experience with the relevant systems.

The solution utilizes RIM's own MDS studio and application suite that facilitates the creation of Blackberry applications that interact with your systems, working with numerous database backends including Oracle, SQL Server, Domino & DB2. The only prerequisite being that the platform supports web services.

The application development environment is true rapid development and does not recreate any of the existing functionality of the back-end system rather the facility to harness remotely.
